Foreword

Certified Reference Materials, as defined in the ISO Guide 30 and the International Vocabulary of Metrology (VIM), can act as traceability links to the International System of Measurement (SI). By application, e.g. of a CRM whose matrix and analyte levels match those of the samples under investigation as closely as possible, the analyst is able to assure himself that his measurements have been properly carried out to the required level of accuracy.

The BAM Federal Institute for Materials Research and Testing has a long tradition in the production of Certified Reference Materials. Starting in 1912 with a "Normal Steel" for the determination of carbon, the development of new CRMs has increased continuously. One year later 8 steel samples with different carbon contents were available. The development continued with the participation of regional German material research and testing institutes as well as industry (1957). In 1968 within the framework of EURONORM, the first European CRMs in the field of iron and steel were issued (see page 10). In 2003 the European Reference Materials (ERM[®]) initiative was launched by BAM together with EUROPEAN COMMISSION JRC and LGC to create a European brand of CRMs of high metrological quality.

Since 2016 BAM is accredited by DAkkS as a producer of RM in accordance with ISO 17034 (General requirements for the competence of reference material producers). The scope of accreditation comprises certified reference materials in the form of non-ferrous metals and alloys, ceramics and glass, soils and sediments, food, ethanol/water solutions, aqueous solutions of stable isotopes, lubricants and fuels as well as porous materials.

Today a large range of ferrous and non ferrous CRMs together with environmental CRMs and CRMs for engineering materials are offered in our new catalogue.

The catalogue provides technical and general ordering information for the CRMs currently available from the BAM Federal Institute for Materials Research and Testing.

BAM holds an accreditation as a reference material producer according to ISO 17034. This accreditation is valid only for the scope as specified in the certificate D-RM-11075-01-00.

DAkkS is a signatory of the multilateral agreement (MLA) between EA, ILAC and IAF for mutual acceptance.

Reference material (RM): material, sufficiently homogeneous and stable with respect to one or more specified properties, which has been established to be fit for its intended use in a measurement process

Note 1 RM is a generic term.

Note 2 Properties can be quantitative or qualitative, e.g. identity of substances or species.

Note 3 Uses may include the calibration of a measurement system, assessment of a measurement procedure, assigning values to other materials, and quality control.

Note 4 A single RM cannot be used for both calibration and validation of results in the same measurement procedure.

Note 5 VIM has an analogous definition (ISO/IEC Guide 99:2007, 5.13), but restricts the term "measurement" to apply to quantitative values and not to qualitative properties. However, Note 3 of ISO/IEC Guide 99:2007, 5.13, specifically includes the concept of qualitative attributes, called "nominal properties".

Certified reference material (CRM): reference material characterized by a metrologically valid procedure for one or more specified properties, accompanied by a certificate that provides the value of the specified property, its associated uncertainty, and a statement of metrological traceability

Note 1 The concept of value includes qualitative attributes such as identity or sequence. Uncertainties for such attributes may be expressed as probabilities.

Note 2 Metrologically valid procedures for the production and certification of reference materials are given in, among others, ISO Guides 34 and 35.

Note 3 ISO Guide 31 gives guidance on the contents of certificates.

Note 4 VIM has an analogous definition (ISO/IEC Guide 99:2007, 5.14).

Note: In this document the comma (and not the dot) is used as a decimal separator.

Ordering BAM reference materials

General

Purchase orders for BAM-CRMs should be directed to:

**Bundesanstalt für Materialforschung
und -prüfung (BAM)
Fachbereich 1.6 Anorganische Referenzmaterialien
Richard-Willstaetter-Str. 11
12489 Berlin, Germany**

Phone: +49 30 8104-2061

Fax: +49 30 8104-72061

Email: sales.crm@bam.de

Webshop: <https://www.webshop.bam.de>

Terms of delivery:

Prices include transport service by mail.

Terms of delivery: free delivery:

BAM usually delivers via DHL.

If another courier or carrier etc. is desired, then the customer bears the costs at the point of destination.

BAM will assume no further costs.

Orders shipping to destinations outside Europe or bulky parcels is charged additionally (flat rate is deducted).

Your products will be packed and shipped asap. Shipment will be performed by standard mail service. Duration of mail delivery cannot be guaranteed by BAM because of different national delivery services.

Iron and steel products	7
EURONORM certified reference materials for the chemical analysis of iron and steel products	8
Unalloyed steels	10
Pure iron	11
Alloy steels.....	12
Highly alloyed steels	16
Special alloys	20
Cast irons	21
Ferro alloys.....	22
Ores, iron oxide	23
Ceramic materials.....	25
Molybdenum oxide	25
Slags.....	26
Steels with certified oxygen and nitrogen content	26
Setting-up sample for spectrometric analysis of low alloyed steels	27
Steel with certified hydrogen content.....	27
Non ferrous metals and alloys.....	29
Aluminium	30
Copper	33
Oxygen in copper	40
Tin-lead solder -	40
Potassiumdicyanoaurate(I)	40
Precious metal alloys	41
Zinc.....	41
Zinc-alloy	41
Lead-alloys.....	42
Lead.....	42
Special materials	45
High tech ceramics	47
Boron carbide powder.....	47
Boron nitride powder.....	47
Yttrium stabilized zirconium oxide	48
Silicon carbide powder	48
Refractory metals Tungsten metal powder	49
Glass containing hexavalent chromium.....	49
Borosilicate glass	49
Medium purity graphite powder	50
Niobium pentoxide	51
Acrylonitrile-butadiene-styrene copolymerisate (ABS).....	51
Pure substances	52
Platinum group elements (PGE) in used automobile catalyst	53
Primary pure substances.....	55
Environment.....	57
Calibration standards "Ethanol in Water"	58
Sulfur in petrol.....	59
Organochloropesticides (OCP) in soil	59
Pentachlorophenol (PCP) in soil	59
Polycyclic aromatic hydrocarbons in soil	60
Mineral oil contaminated sediment and soil.....	61
Polychlorinated biphenyls in soil	61
Trace elements in contaminated sandy soil and river sediment	62
Trace elements in contaminated soils.....	62

Food	65
Acrylamide in crispbread.....	66
Acrylamide in rusk.....	66
Fusarium mycotoxins in wheat flour.....	66
T-2 and HT-2 toxin in oat flakes.....	66
Gas mixtures	67
Certified reference gas mixtures.....	68
Binary certified reference gas mixtures.....	68
Certified reference gas mixtures for vehicle exhaust emission measurements.....	69
Certified reference gas mixtures for gas calorimeters.....	69
Multicomponent certified reference gas mixtures.....	69
Certified reference gas mixtures for process gas chromatographs.....	70
Elastomeric materials	75
Standard reference elastomers (SRE) from vulcanized rubbers.....	76
Optical properties	79
X-ray film step tablet.....	80
Calibration kit Spectral fluorescence standards.....	80
Glass-based multi-emitter fluorescence standard.....	81
Porous reference materials	83
CRMs for the gas adsorption method.....	84
CRMs for the mercury intrusion method.....	85
Layer and surface reference materials	89
Nanoscale stripe pattern for testing of lateral resolution and calibration of length scale.....	90
Testmaterial and software for performance check of X-ray spectrometer (EDS).....	92
Particle size distribution	93
CRM for particle size distribution by laser diffraction methods according to ISO 13320.....	94
Polymeric reference materials	95
CRMs for the determination of the molecular weight.....	96
Isotopic reference materials	97
CRMs certified for the isotopic composition of boron.....	98
CRM certified for the isotopic composition of cadmium.....	100
CRM certified for the mass fraction and the isotopic composition of palladium.....	101
CRM certified for the mass fraction and the isotopic composition of platinum.....	102
CRM certified for the isotopic composition of lead.....	103
CRM certified for the isotopic composition of magnesium.....	104
Experts	105
CRMs under development	109

Iron and steel products

EURONORM certified reference materials for the chemical analysis of iron and steel products

EURONORM certified reference materials are prepared under the auspices of the European Committee for Iron and Steel Standardization (ECISS) in a collaboration between the producing organizations in:

France: Institute de Recherches de la Sidérurgie (IRSID), Centre de Développement des Industries de Mise en Forme des Matériaux (CTIF),

the Federal Republic of Germany: Iron and Steel CRM Working Group comprising Bundesanstalt für Materialforschung und -prüfung (BAM), Max-Planck-Institut für Eisenforschung, Stahlinstitut VDEh,

Sweden/Finland: Jernkontoret, Corrosion and Metals Institute (Swerea KIMAB).

Starting in 1968 EURONORM-CRMs have been analysed by laboratories in the European Community (EC) and further European countries. These samples are indicated by an asterisk in the tables. A number of former national CRMs are also listed in the tables. After examination by laboratories in the EC they have been accepted as EURONORM-CRMs.

Approximately 20 laboratories take part in the analysis. Each laboratory is requested to analyse the elements to be determined four times. A statistical evaluation of the laboratory mean values is carried out with respect to their normal distribution and the identification of any outlying values.

The finely divided EURONORM-CRMs are supplied in glass bottles containing 100 g. Some EURONORM-CRMs are also available in solid form (discs). Samples in the form of chips, pins and balls with certified oxygen and nitrogen content are also available.

This catalogue represents European CRMs of German origin. For CRMs of British and French origin please contact the above mentioned producers. Details of all ECRMs are given in CEN-Report CR 10317 and CEN TR 10350 (ECSC), both of which are available from the national standards body in your country.

Types of material

The following types of material are available as EURONORM-CRM:

Unalloyed steels (0), alloyed steels (1), highly alloyed steels (2), special alloys (3), cast iron (4), ferro-alloys (5), ores (6), ceramics (7) and slags (8).

Our system of numbering of the samples allows an easy orientation about the type of material. The first digit of the sample number shows the type of material (0 - unalloyed steel, 1 - low alloyed steel, 2 - highly alloyed steel etc.). The second and third digit characterizes the single sample. Another digit, separated by a hyphen gives the number of editions of the material.

Content of the certificate

On the head of the certificate the EURONORM-number and the type of material of the sample is given. The mean values of the laboratories involved in the certification campaign are given in a table together with indicative values. The mean values of the accepted data sets, their standard deviations and the standard deviations of the laboratories are also given in the table. The sign "-" in the table stands for an outlier pointed out by statistical tests. The certified values are given in a second table together with their uncertainties (95%-level) or standard deviations. Additionally the following information are given: The owner of the material, a characterization of the sample (e.g. grain size, dimensions of compact samples), the laboratories involved in the certification campaign, the analytical methods used for element determination, sources for getting additional information published by ECISS/EGKS.

The following information are given in the tables:

* - analysed by 20 to 25 European laboratories

Indicative values (not certified) are given in parentheses.

Authentic for the certified element contents are only the values given in the certificates, not the values given in this catalogue.

Samples for the determination of nitrogen and oxygen (N-O-materials)

Three different types of material are available:

Unalloyed steel: the pin-shaped material (100 mm long, 8 mm in diameter) forms an iron oxide coating. Before analysis this layer has to be removed by turning and care has to be taken to prevent a reoxidation of the cleaned surface.

Highly alloyed stainless steel: after formation of a reproducible and constant oxide layer the chipped material is protected (passivated) against further oxidation. There is no need for sample pretreatment.

Ball-bearing steel: The surfaces of the balls are protected against oxidation by a layer of gold. The diameter of the balls is kept constant with high reproducibility resulting in masses of $1,00050 \text{ g} \pm 0,00015 \text{ g}$. Weighing of the material is not necessary.

Samples for optical emission and X-ray fluorescence spectrometry

The samples are in form of discs (cylinders of 36 to 41 mm diameter and 20 to 35 mm height) and normally also available in form of chips. The samples 035-2 and 290-1/291-1 are prepared by hot isostatic pressing (HIP) of powder which was atomized from the melt and solidified in inert gas giving a material of high homogeneity.

Unalloyed steels

Setting-up sample for spectrometric analysis of low alloyed steels

BAM SUS-1 R

The setting-up sample is suitable for direct reading spark emission and X-ray fluorescence spectrometers analysing low alloyed steels.

The material was prepared by hot isostatic pressing (HIP) of powder which was atomised from the melt of the alloy and solidified in inert gas. Therefore it is of particular high homogeneity. Analysis of the sample was carried out in BAM.

Dimensions: cylinder, 50 mm in diameter, 42 mm high

Non ferrous metals and alloys

The **aluminium, copper, lead and zinc based samples** were produced and certified by BAM in collaboration with the Working Groups „Aluminium“, „Copper“, „Lead“ and „Zinc“ of the Committee of Chemists of the Gesellschaft für Bergbau, Metallurgie, Rohstoff- und Umwelttechnik (GDMB).

The analyses were carried out in BAM and in laboratories of the non ferrous metals industry. The finely divided samples are supplied in glass bottles containing 100 g each.

Cylindrical samples in block form have been especially designed for spark emission and X-ray fluorescence spectrometers.

The **aluminium discs** are 2,5 to 5 cm high and 4 to 6 cm in diameter and have been analysed by 10 to 15 industrial laboratories (depending on the element) involved in an interlaboratory comparison organized by BAM.

The **copper blocks** of cylindrical shape have an approximate height of 3 cm and a diameter of about 4 cm. **Lead blocks** of cylindrical shape have a height of 3 - 4 cm and a diameter of 4 - 5 cm.

Zinc blocks of cylindrical shape have a height of 3 cm and a diameter of about 4,5 cm.

The granulated **tin solder** was certified in a German-French collaboration by the Bureau National de Métrologie, involving several industrial laboratories of both countries. The sieved material (fraction 40 to 200 µm) is available from BAM in glass bottles containing 100 g each.

Potassiumdicyanoaurate(I) is provided for wet chemical analysis. It was certified by BAM in collaboration with the Working Group „Precious Metals“ of the Committee of Chemists of the GDMB. It is available in glass bottles containing 6 g each.

Each sample is distributed together with a certificate which contains the certified values together with their uncertainties (95%-level) and the indicative values. The mean values of the accepted data sets, their standard deviations and the standard deviations of the laboratories are also given in the certificate together with the laboratories participating in the certification campaign and the analytical methods used for element determination.

Authentic for the certified element contents are only the values given in the certificates, not the values given in this catalogue.

CRM-No.	BAM-379/1	BAM-379/2	BAM-379/3
Description	Pure copper	Pure copper	Pure copper
Cu	(matrix)	(matrix)	(matrix)
O	38 ± 4	212 ± 8	378 ± 12

(Values in parentheses are indicative values)

The samples 379/1 to 379/3 (year of issue: 2000) are available individually as well as in a set of all three samples. Each cylinder is 3 cm high and about 4 cm in diameter.

These samples are not certified reference materials as defined in the relevant standards because during certification analysis calibration was done using existing reference materials instead of pure chemicals or stoichiometric compounds.

Special materials

The CRMs in the field of **high tech ceramics** and of **refractory metals** were produced and certified by BAM in collaboration with the Working Group "Special Materials" of the Committee of Chemists of the Gesellschaft für Bergbau, Metallurgie, Rohstoff- und Umwelttechnik (GDMB). The analyses were carried out in BAM and in national and international laboratories of producers and users of these materials and of research institutes. The powder samples are supplied in tightly closed glass bottles containing 50 g or 100 g each.

The **glass** CRMs were produced and certified by BAM in collaboration with the Technical Committee 2 of the International Commission on Glass (ICG, TC-2). The analyses were carried out in BAM and in the laboratories of international members of ICG, TC-2 and some other laboratories. All laboratories are from glass making industry or from glass research institutes. The crushed glass sample (BAM-S004) is supplied in glass bottles containing 50 g each.

The material **BAM-H010** intended for use in quality assurance of measurements of elements in polymers and related matrices in order to support e.g. the EU directive 2002/95/EG (RoHS). The development and production of the acrylonitrile-butadiene-styrene terpolymer (ABS) has been carried by the Fachhochschule Münster. The certification process has been carried out by BAM. The reference material is available in form of granulate (100 g) or as discs with a diameter of 4 cm and a thickness of 1, 2 or 6 mm.

The **pure substances** are intended for analyte calibration and matrix simulation of atomic spectrometric methods, especially for X-ray fluorescence analysis (XRF). The samples were prepared and certified by Arbeitsgemeinschaft "Zertifiziertes Referenzmaterial Eisen und Stahl" (BAM, VDEh, MPI für Eisenforschung), Working Group "Primary substances for calibration". They can be ordered in polyethylene bottles with a unit size of 100 g. Each sample is distributed together with a certificate which contains the certified values together with their uncertainties (95%-level, if necessary extended by contributions from sample inhomogeneity) and the indicative values. The mean values of the accepted data sets, their standard deviations and the standard deviations of the mean values of laboratories are also given in the certificate together with the laboratories participating in the certification campaign and the analytical methods used for determination of element mass fractions or other parameters.

High tech ceramics Boron carbide powder

ERM®-ED102

B ₂ O ₃ adherent	0,070	0,014	%
C	(0,018)	(0,009)	%
H ₂ O	(<0,1)	–	%

(Values in parentheses are indicative values)

¹⁾ The certified values are the means of 5 - 13 series of results (depending on the parameter) obtained by different laboratories. Up to 6 different analytical methods were used for the measurement of each parameter. The calibration of the methods applied for determination of element mass fractions were carried out by using pure substances of definite stoichiometry or solutions prepared from them, thus, ensuring traceability to SI units.

²⁾ The certified uncertainty is the expanded uncertainty estimated in accordance with the Guide to the Expression of Uncertainty in Measurements (GUM) with a coverage factor $k = 2$. It includes contributions from sample inhomogeneity and sample stability.

Yttrium stabilized zirconium oxide

ERM®-ED105

Analyte	Certified value ¹⁾	Uncertainty ²⁾	Unit of mass fraction

Hf	1,535	0,024	%
Y	6,11	0,09	%
P	(< 75)	–	mg/kg
ZrO ₂ (monoclinic)	(1,94)	–	%

(Values in parentheses are indicative values)

¹⁾ The certified values are the means of 11-20 series of results (depending on the parameter) obtained by different laboratories. Up to 7 different analytical methods were used for the measurement of each parameter. The methods applied for determination of element mass fractions were calibrated using pure substances of definite stoichiometry or solutions prepared from them, thus achieving traceability to the International System of Units (SI).

²⁾ The uncertainty of the certified value is the expanded uncertainty estimated in accordance with the Guide to the Expression of Uncertainty in Measurement (GUM) with a coverage factor $k = 2$. It includes contributions from sample inhomogeneity.

¹⁾Unweighted mean value of the means of accepted sets of data, each set being obtained by a different laboratory and/or a different method of measurement.

²⁾Estimated expanded uncertainty U with a coverage factor of $k = 2$, corresponding to a level of confidence of approx. 95 %, as defined in the Guide to the expression of uncertainty in measurement, (GUM, ISO/IEC Guide 98-3:2008).

³⁾Unweighted mean value of the means of accepted sets of data, each set being obtained by a different laboratory and/or a different method of measurement. Values were not certified, but given for information, when the number of accepted data sets were considered to be too low (< 5) or when the uncertainty from the inter-laboratory certification was considerably larger than the expected range or homogeneity data are lacking.

⁴⁾Method specific value obtained using ETV-ICP OES with an evaporation temperature of 2300 °C, according to DIN 51457: 2017-05, Testing of ceramic raw and basic materials - Direct determination of mass fractions of trace impurities in powders, granules and lumps of graphite by optical emission spectroscopy by inductively coupled plasma (ICP OES) and by electrothermal vaporization (ETV) under the action of a halogenated reaction gas (modifiers). For further details see technical report.

(Values in parentheses are indicative values)

¹⁾ α-quartz, mean particle size: 150 µm

²⁾ α-aluminium oxide, average surface: 5,6 m²/g, bulk density: ca. 1,1 kg/L

³⁾ Pure calcite, the CO₂-content is given for the water free sample. It is 99,96 % of the theoretical value.

⁴⁾ Pure electrolytic nickel, the weight of one particle after milling is about 2 – 4 mg.

⁵⁾ Powdered nickel(II)oxide made by oxidation of powdered nickel (made by thermal decomposition of nickel carbonyl) with a particle size of 5 – 20 µm.

⁶⁾ Crystalline magnesium oxide with two different particle sizes

Platinum group elements (PGE) in used automobile catalyst

ERM[®]-EB504a ^{Δ)}

Element	Certified value ¹⁾	Uncertainty ²⁾
Mass fraction in mg/kg		
Pt	1414	9
Pd	1596	11
Rh	210,0	2,2

¹⁾ Unweighted mean value of the means of accepted sets of data, each set being obtained in a different laboratory and/or with a different method of determination. The values are traceable to the SI (Système International d'Unités) by the use of pure substances of known stoichiometry for calibration. Before analysis the material was dried for 8 h at 105 °C.

²⁾ Estimated expanded uncertainty *U* with a coverage factor of *k* = 2, corresponding to a level of confidence of about 95 %, as defined in the ISO/IEC Guide 98-3:2008 [Uncertainty of measurement -- Part 3: Guide to the expression of uncertainty in measurement (GUM:1995)].

^{Δ)} Accredited by DAkkS as a producer of RM in accordance with ISO Guide 34 in combination with ISO/IEC 17025

Primary pure substances

By agreement with Physikalisch Technische Bundesanstalt (PTB) the materials in this group are the National Standards for Element Analysis in Germany. They are available only to the signatories (National Measurement Institutes) and designated laboratories as listed in the Mutual Recognition Arrangement MRA [<http://www.bipm.org/en/cipm-mra/>].

The substances are of high purity, and certified for the mass fraction of the matrix element by considering all possible impurities with other chemical elements. They are intended for gravimetric preparation of calibration solutions for analyte calibration with small combined uncertainty and enable to establish traceability to the international system of units (SI).

The material is supplied in glass bottles together with the certificate, which includes the prescribed procedure for etching before use and the informative values for the individual impurities. The certification reports are available on request.

Environment

Calibration standards “Ethanol in Water”

The certified reference materials are solutions of ethanol in water, prepared gravimetrically in units of about 4 L. The ethanol concentration at 20 °C is certified.

Application: Calibration of breath alcohol analysers according to DIN VDE 0405-4; validation of methods for the analysis of ethanol in aqueous samples

Identifier	Concentration g/L	Expanded Uncertainty g/L
BAM-K001	1,0292	± 0,0010
BAM-K002	0,0000	± 0,0001
BAM-K003	0,6100	± 0,0006
BAM-K004	1,2100	± 0,0012
BAM-K005	1,4500	± 0,0014
BAM-K006	1,8200	± 0,0018
BAM-K007	3,3900	± 0,0033

Currently, the calibration standards are only sold to customers in Germany. Certificates are only available in German. To customers outside of Germany the standards may be sold on request. Please pay attention to the delivery notes given in our webshop [<https://webshop.bam.de>]!

Sulfur in petrol

ERM®-EF213

This material is a petroleum product containing sulfur (S) in its natural forms, closely matching commercial petrol fuels at a sulfur concentration slightly lower than actual legal limits in Germany and EU. The absence of artificially added sulfur species avoids any effects arising from species specific analytical methods. A suitable supply of petrol was obtained in bulk from ESSO Deutschland GmbH, Ingolstadt, Germany. The main purpose of the materials is to assess method performance, i.e. for checking accuracy of analytical results. As any reference material, it can also be used for control charts or validation studies.

Certified property	Mass fraction	
	Certified value ¹⁾ mg/kg	Uncertainty ²⁾ mg/kg
S	9,1	0,8

¹⁾ Unweighted mean of three sets of results obtained using isotope-dilution mass spectrometry applied as primary method of measurement. The value is traceable to the International System of Units (SI).

²⁾ The certified uncertainty is the expanded uncertainty estimated in accordance with the Guide to the Expression of Uncertainty in Measurement (GUM) with a coverage factor of $k=2$, corresponding to a level of confidence of about 95%

Organochloropesticides (OCP) in soil

ERM®-CC007a

Certification of the content of six DDT, DDE and HCH isomers in industrial soil.

Use of CRM for the validation and checking of the accuracy of analytical procedures for the quantitative determination of the contents of selected relevant organochloropesticides in soil by gas chromatography.

Compound	Certified value ¹⁾	Uncertainty ²⁾
α-HCH	219	23
β-HCH	1570	210
γ-HCH	21,4	2,6
p,p'-DDE	380	60
o,p'-DDT	340	50
p,p'-DDT	960	140

All values are given in µg/kg

¹⁾ The certified value is the mean of 7-8 laboratory means using GC-ECD and GC-MS including IDMS. The values are traceable to the SI (Système International d'Unités) via calibration using substances with certified purity.

²⁾ Estimated expanded uncertainty with a coverage factor of $k=2$, corresponding to a level of confidence of 95 %, as defined in the Guide to the Expression of Uncertainty in Measurement, (GUM, ISO), 1993.

Pentachlorophenol (PCP) in soil

ERM®-CC008 (BAM-U008), ERM®-CC009 (BAM-U009)

Certification of the content of PCP in two industrial soils.

Use of CRMs for the validation and checking of the accuracy of analytical procedures for the quantitative determination of the content of pentachlorophenol in soil.

CRM-No.	Compound	Certified value ¹⁾	Uncertainty ²⁾
ERM®-CC008	Pentachlorophenol (PCP)	2,04	0,18
ERM®-CC009	Pentachlorophenol (PCP)	2,91	0,23

All values are given in mg/kg

¹⁾ Unweighted mean value of 5 laboratory means using three different chromatographic methods combined with four detection principles (see below). The values are traceable to the SI (Système International d'Unités) via calibration using sufficiently pure substances.

²⁾ Estimated expanded uncertainty with a coverage factor of $k=2$, corresponding to a level of confidence of about 95 %, as defined in the Guide to the Expression of Uncertainty in Measurement (GUM, ISO), 1995.

Polycyclic aromatic hydrocarbons in soil

BAM-U013c^Δ)

Certified properties: Contents of 15 ¹⁾ of priority pollutant polycyclic aromatic hydrocarbons (PAH) according to EPA and the sum of the 15 listed PAH in industrial soil

Application: Validation and checking of the accuracy of analytical procedures for the quantitative determination of the contents of PAH in soil or similar solid matrices

Compound	Certified value ²⁾	Uncertainty ³⁾
Naphthalene	1,9	0,4
Acenaphthene	0,69	0,14
Fluorene	0,98	0,09
Phenanthrene	7,0	0,5
Anthracene	2,38	0,12

Chrysene	10,6	0,6
Benzo[b]fluoranthene	11,3	1,2
Benzo[k]fluoranthene	4,7	0,3
Benzo[a]pyrene	8,1	0,8
Dibenz[a,h]anthracene	2,02	0,26
Benzo[ghi]perylene	5,5	0,4
Indeno[1,2,3-cd]pyrene	5,5	0,5
PAH sum	94,2	4,0

All values are given as mass fractions in mg/kg

¹⁾ The mass fractions of Acenaphthylene (0,65 mg/kg) are given as not certified indicative values.

²⁾ The certified values are the unweighted mean value of 16 laboratory means using HPLC/DAD/F or GC/MS. The values are traceable to the SI (Système International d'Unités) via calibration using sufficiently pure substances.

³⁾ Estimated expanded uncertainty with a coverage factor of $k=2$, corresponding to a confidence level of approximately 95 %, as defined in the Guide to the Expression of Uncertainty in Measurement (GUM), ISO, 2008.

^{Δ)} Accredited by DAKKS as a producer of RM in accordance with ISO Guide 34 in combination with ISO/IEC 17025

Mineral oil contaminated sediment and soil

BAM-U015b, BAM-U021 and BAM-U022

Certified properties: Mineral oil content or total hydrocarbon (TPH) in sediment or soil to be determined by GC/FID

Application: Validation and checking of the accuracy of analytical procedures for the quantitative determination of mineral oil in sediment by gas chromatography (GC-FID) according to ISO 16703:2004 (soil quality)

CRM-No.	Measurand	Certified value ¹⁾	Uncertainty ²⁾
BAM-U015b sediment	Total petrol hydrocarbon (TPH)	920	100
BAM-U021 soil	Total petrol hydrocarbon (TPH)	3560	260
BAM-U022 sediment	Total petrol hydrocarbon (TPH)	8270	550

All values are given in mg/kg.

¹⁾ Unweighted mean value of 13-14 laboratory means using gas chromatography with flame ionisation detection (GC/FID) according to ISO 16703:2005.

²⁾ Estimated expanded uncertainty with a coverage factor of $k=2$, corresponding to a confidence level of approximately 95 %, as defined in the Guide to the Expression of Uncertainty in Measurement (GUM), ISO, 2008

Polychlorinated biphenyls in soil

BAM-U019

Certified properties: Content of selected PCB congeners in soil to be determined by GC-ECD or GC-MS

Application: Validation and checking of the accuracy of analytical procedures for the quantitative determination of PCB in soil by gas chromatography (GC-ECD or GC-MS)

Compound	Certified value ¹⁾	Uncertainty ²⁾
PCB 28	0,50	0,13
PCB 44	2,04	0,29
PCB 52	2,96	0,62
PCB 101	2,90	0,68

All values are given in mg/kg.

¹⁾ Estimated expanded uncertainty with a coverage factor of $k=2,5$, corresponding to a level of confidence of about 95 %, as defined in the Guide to the Expression of Uncertainty in Measurement (GUM), ISO, 1995.

Trace elements in contaminated soils

BAM-U110

Certified properties: Total and aqua regia extractable (ISO 11466) mass fractions

The material is intended for the verification of analytical results obtained by standardised procedures as well as for the validation of modified or new analytical procedures. Furthermore, it can be used for quality control or calibration purposes if X-ray fluorescence spectrometry or other methods of direct solid state analysis are applied.

Analyte	Total mass fractions		Aqua regia extractable mass fractions

The certified values are corrected to the dry mass content of the material determined according to ISO 11465. They are operationally defined by the analytical protocols given in EN 16174.

¹⁾ Extraction procedure according to EN 16174, Method A, is identical to the analytical protocol given in ISO 11466.

²⁾ Estimated expanded uncertainty with a coverage factor of $k = 2$, corresponding to a level of confidence of approximately 95 %, as defined in the Guide to the Expression of Uncertainty in Measurement (GUM, ISO/IEC Guide 98-3:2008).

^{Δ)} Accredited by DAKKS as a producer of RM in accordance with ISO Guide 34 in combination with ISO/IEC 17025

Food

Acrylamide in crispbread

ERM[®]-BD272

Compound	Certified value ¹⁾	Uncertainty ³⁾
Acrylamide	0,98 mg/kg	0,09 mg/kg

Acrylamide in rusk

ERM[®]-BD274

Compound	Certified value ²⁾	Uncertainty ³⁾
Acrylamide	74 µg/kg	7 µg/kg

¹⁾ Unweighted mean of accepted mean values, independently obtained by 15 laboratories using different analytical methods.

²⁾ Unweighted mean of accepted mean values, independently obtained by 8 laboratories using different analytical methods.

³⁾ Estimated expanded uncertainty with a coverage factor of $k=2$, corresponding to a confidence level of about 95 %, as defined in the Guide to the Expression of Uncertainty in Measurement (GUM), ISO, 1995. Uncertainty contributions arising from characterisation as well as from homogeneity and stability testing were taken into account.

Fusarium mycotoxins in wheat flour

ERM[®]-BC600

Compound ¹⁾	Certified value ²⁾	Uncertainty ³⁾
Deoxynivalenol (DON)	102 µg/kg	11 µg/kg
Nivalenol (NIV)	1000 µg/kg	130 µg/kg
Zearalenone (ZON)	90 µg/kg	8 µg/kg

¹⁾ DON, NIV and ZON as measured by using appropriate sample preparation techniques (e.g. solvent extraction, clean-up, derivatisation), instrumental separation (HPLC, GC) and detection techniques corrected for extraction efficiency/recovery.

²⁾ Unweighted mean of accepted mean values, independently obtained in different laboratories using various methods. The certified values are traceable to the SI.

³⁾ Estimated expanded uncertainty with a coverage factor of $k=2$, corresponding to a confidence level of about 95 %, as defined in the Guide to the Expression of Uncertainty in Measurement (GUM), ISO, 1995. Uncertainty contributions arising from characterisation as well as from homogeneity and stability testing were taken into account.

T-2 and HT-2 toxin in oat flakes

ERM[®]-BC720

Compound ¹⁾	Certified value ²⁾	Uncertainty ³⁾
T-2 toxin [CAS number: 21259-20-1]	82 µg/kg	4 µg/kg
HT-2 toxin [CAS number: 26934-87-2]	81 µg/kg	4 µg/kg

¹⁾ T-2 and HT-2 toxin measured using sample preparation, instrumental separation (HPLC) and mass spectrometric detection as specified on page 3 of this certificate.

²⁾ The value given represents the unweighted mean value of 80 results (obtained by BAM). Certified values are traceable to the SI

³⁾ Estimated expanded uncertainty with a coverage factor of $k=2$, corresponding to a confidence level of about 95 %, as defined in the Guide to the Expression of Uncertainty in Measurement (GUM), ISO/IEC Guide 98-3 (2008). Uncertainty contributions arising from characterisation as well as from homogeneity and stability testing were taken into account.

Gas mixtures

Certified reference gas mixtures

The following certified reference gas mixtures (CRGMs) are prepared by BAM or industrial partners under mandate of BAM.

These CRGMs are offered and distributed by BAM exclusively.

CRGMs are prepared individually from pure gases according to ISO 6142 "Gas analysis – Preparation of calibration gases – Gravimetric method".

Pre-mixtures are employed for the preparation of CRGMs with minor components. The molar fraction of the components are certified according to ISO 6143 "Gas analysis – Determination of composition of calibration gas mixtures – Comparison methods" using primary reference gas mixtures (national primary standards of gas composition).

At request, calibration gas mixtures prepared by industrial customers and accepted by BAM can be certified by comparison with corresponding primary reference gas mixtures. These BAM-certified calibration gas mixtures are then used as reference standards, providing traceability to primary reference gas mixtures maintained at BAM. The stability is generally guaranteed over a period of two years.

Uncertainties are reported as expanded uncertainties (coverage factor $k=2$) according to GUM.

Elastomeric materials

Standard reference elastomers (SRE) from vulcanized rubbers

Standard Reference Elastomers (SRE) are characterized by standardized and controlled properties. One application area is the calibration of scientific and technical test apparatuses and methods (E001 and E003). They enable the exact determination of material data if the method of measuring by itself cannot give absolute measured values. They can further be used as part of a measuring device (E002, E004 to E007). The SRE E001, E003 to E007 consist of natural rubber (NR).

SRE made from nitrile rubber (NBR), hydrogenated nitrile rubber (HNBR), ethylene-propylene diene rubber (EPDM), polyacrylate rubber (ACM), silicone rubber (MVQ), fluoropolymer rubber (FKM) and chloroprene rubber (CR) are meant to determine the effect of mineral oils, lubricants, hydraulic liquids and other service fluids on vulcanizates made from the mentioned rubbers which are used for seals, hoses etc. They are different in their degree of swelling (E008 to E021). In most cases the physical properties of the elastomers such as density, hardness, compression set and tensile stress-strain are also specified.

The following SRE from vulcanized rubbers and for testing of vulcanized rubber products (E002) are produced and offered:

BAM-E001	Rubber test sheet for determination of abrasion resistance of vulcanized rubber according to DIN 53516 and ISO 4649 standard reference compound no. 1
BAM-E002	Abrasive paper sheet - according to DIN 53516 and ISO 4649; Annex A
BAM-E003	Rubber test sheet for determination of abrasion resistance of vulcanized rubber according to ISO 4649 standard reference compound no. 2
BAM-E004	Rubber sole sheet for measuring the electrostatic charging of floor by a walking test
BAM-E005	Rubber base ring for the portable tester for measuring the surface roughness of streets (Efflux meter in accordance with MOORE) according to EN 13036-3
BAM-E006/ BAM-E007	Rubber slider for the pendulum tester for measuring the surface grip property of streets (skid resistance test; SRT) according to EN 13036-4: 2003; CEN rubber and for the pendulum tester for the determination of the PSV-value (polished stone value) according to EN 1097-8
BAM-E008	Elastomer ISO 13226 SRE-NBR 28/PX designated for hydraulic area (vulcanized with peroxide, low elongation at break)
BAM-E009	Elastomer ISO 13226 SRE-NBR 28/SX designated for automotive area (vulcanized with thiurame, high elongation at break)
BAM-E010	Elastomer ISO 13226 SRE-NBR 34/SX designated for automotive area (vulcanized with thiurame, high elongation at break)
BAM-E011	Elastomer ISO 13226 SRE-HNBR/1X designated for hydraulic and automotive area (vulcanized with peroxide)
BAM-E012	Elastomer ISO 13226 SRE-ACM/1X designated for hydraulic and automotive area
BAM-E013	Elastomer ISO 13226 SRE-VMQ/1X designated for hydraulic and automotive area (vulcanized with peroxide)
BAM-E014	Elastomer ISO 13226 SRE-FKM/2X / ISO 6072 FKM 2 designated for hydraulic and automotive area
BAM-E015	Elastomer ISO 6072 NBR 1 designated for hydraulic and automotive area
BAM-E016	Elastomer ISO 6072 NBR 2 designated for hydraulic and automotive area
BAM-E017	Elastomer ISO 13226 SRE-NBR L designated for hydraulic and automotive area (vulcanized with thiurame, low content of acrylonitrile)
BAM-E018	Elastomer ISO 13226 SRE-NBR M designated for hydraulic and automotive area (vulcanized with thiurame, medium content of acrylonitrile)
BAM-E019	Elastomer ISO 6072 EPDM 1 designated for hydraulic and automotive area
BAM-E020	Elastomer ISO 6072 HNBR 1 designated for hydraulic and automotive area
BAM-E021	Elastomer ISO 13226 SRE-CR/1 designated for hydraulic and automotive area
BAM-E022	Rubber Slider for the pendulum tester (Skid Resistance Test, SRT) according to EN 13036-4: 2011; slider 57
BAM-E023	Rubber Slider Pad for the pendulum tester (SRT) according to EN 13036-4:2003; CEN rubber
BAM-E024	Rubber Slider Pad for the pendulum tester (SRT) according to EN 13036-4:2011; slider 57
BAM-E025	Reference Material for the determination of rebound resilience according to ISO 4662

BAM-E026 **Rubber Slider** for the pendulum tester according to EN 1436:2009, annex D

BAM-E027 **Rubber Slider** for the pendulum tester according to EN 1338:2003/AC:2006, annex I

In addition to the described applications, these SRE can generally be used in all cases in which elastomers with defined and reproducible properties are needed.

Optical properties

X-ray film step tablet

BAM-X001

Calibrated X-ray film step tablet of 15 steps

Covered optical density range: 0,25 – 5,0

Film type: Agfa - Gevaert Structurix D4

Calibration kit

Spectral fluorescence standards

BAM-F001b, BAM-F002b, BAM-F003b, BAM-F004b, BAM-F005b

For the determination of the relative spectral responsivity of fluorescence instruments, the control of the long-term stability of fluorescence instruments, and for the determination of corrected, i.e., instrument-independent emission spectra.

Five spectral fluorescence standards ready made by SIGMA-ALDRICH GmbH (now part of Merck KGaA), which cover the spectral region of 300 nm to 770 nm as a set.

This Reference Material is issued by BAM and distributed by SIGMA-ALDRICH GmbH.

Catalog Keyword: Spectral fluorescence standard kit (Product number: 75255)

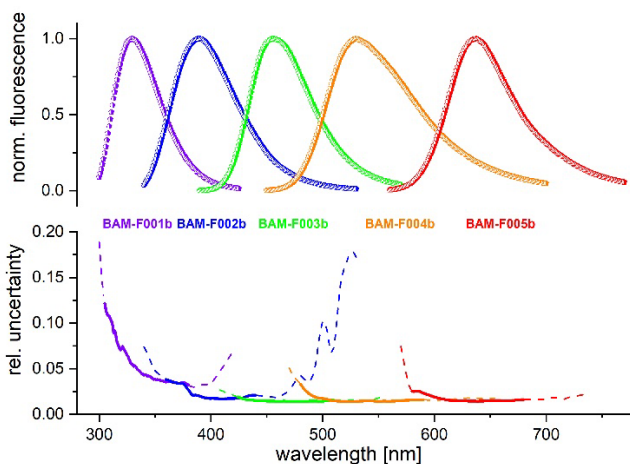

Addition of aliquots of 10 mL of ethanol to each solid standard yields a solution that can be measured without additional dilution steps.

Corrected emission spectra of BAM-F001b - BAM-F005b certified with a calibrated reference spectrofluorometer and the corresponding wavelength-dependent expanded relative uncertainties. Certification was performed according to ISO Guide 35 and the Guide to the Expression of Uncertainty in Measurement (GUM).

CD with the Certificate, the data evaluation software *LINKCORRWin1.3* including the certificate file BAM1808M6.CTF developed by BAM, and instructions for use of BAM-F001b - BAM-F005b and *LINKCORRWin1.3*.

Certified properties

Normalized corrected fluorescence emission spectra of BAM-F001b - BAM-F005b in ethanol for $T = 25\text{ °C}$. The emission spectra are traceable to the spectral photon radiance scale realized and disseminated in Germany by the Physikalisch-Technische Bundesanstalt (PTB) Berlin.

Certified normalized corrected fluorescence emission spectra of

← BAM-F001b – BAM-F005b

and

← expanded relative uncertainties

Glass-based multi-emitter fluorescence standard

BAM-F012

Intended as standard for Instrument Performance Validation (IPV) of fluorescence instruments with continuous excitation sources by regular evaluation of variations of the emission intensity pattern measured under identical measurement conditions.

The reference material consists of a rectangular block of a fluorescent multi-emitter (ME) glass with typical cuvette dimensions (12.5 mm x 12.5 mm x 40 mm) and four polished long faces.

The fluorescence spectrum of the ME glass consists of several relatively sharp emission bands in the wavelength region between 450 nm and 720 nm. The normalized emission intensities, used for certification of the emission intensity pattern were derived from an emission spectrum corrected for the instrument-specific spectral responsivity $s(\lambda)$ of the BAM reference fluorometer equipped with a continuous excitation light source (excitation at $\lambda_{exc} = 365$ nm).

A Standard Operation Procedure (SOP) for use of fluorescence standard BAM-F012 is included.

The reference material is ready-to-use.

Certified properties

Normalized intensities of eight emission peaks (“emission intensity pattern”) of the multi-emitter (ME) glass BAM-F012. The intensities of the emission peaks were normalized by the sum of the signal maxima.

Emission intensity pattern of BAM-F012 with uncertainties using a coverage factor of $k=2$ corresponding to a confidence interval of approximately 95 %, as defined in GUM (ISO/IEC Guide 98-3:2008).

⁴⁾ y_2 : Pressure at 57,5 % of the saturation value. This value has been determined by local polynomial estimation (Epanechnikov kernel with band width $h = 0,05$ MPa).

⁵⁾ y_3 : Difference of the pressures at which the intrusion curve has got 87,5 % and 25 % respectively of the saturation value.

BAM-P128

Porosity properties of macroporous alumina ceramic calculated from the mercury intrusion up to a maximum pressure between 0,2 and 0,4 MPa

Property	Certified value ^{a)}	Uncertainty ^{b)}	Unit
Specific pore volume ^{c)} V_p	220	6	mm ³ g ⁻¹
Median pore diameter ^{d)} d_{50}	27,6	1,0	μm
Informative value			
Density ρ_s	3,6405	0,0019	g/cm ³

^{a)} Mean value of the means of accepted data sets each derived from at least 19 single values.

^{b)} Uncertainty $U = k \cdot u_c$ calculated according to ISO Guide 35 and ISO/IEC Guide 98 with the coverage factor $k=2$ (giving a level of confidence of approximately 95 %). The combined standard uncertainty u_c of each certified property includes uncertainty contributions resulting from the interlaboratory testing, the study of inhomogeneities and stability of the material.

^{c)} Specific pore volume V_p calculated from the mercury intrusion with maximum pressure in a low-pressure device. Described in ISO 15901-1 and DIN 66133.

^{d)} Median pore diameter d_{50} calculated according to the Washburn equilibrium model as described in ISO 15901-1 and DIN 66133.

Layer and surface reference materials

Nanoscale stripe pattern for testing of lateral resolution and calibration of length scale

BAM-L200

BAM-L200 is a certified reference material for determination and control of lateral resolution in surface chemical analysis by SIMS, AES or XPS and covers the range from 2 nm to 600 nm. The cross section of a semiconductor layer stack is conductive, suitable for ultra high vacuum applications and can be used by all methods of surface analysis which are sensitive to a material contrast between $\text{Al}_{0.7}\text{Ga}_{0.3}\text{As}$ and GaAs.

Characteristic	Certified value	Expanded ($k=2$)

EDS-TM002 and performance test programme for the determination of the properties of an energy dispersive X-ray spectrometer (EDS)

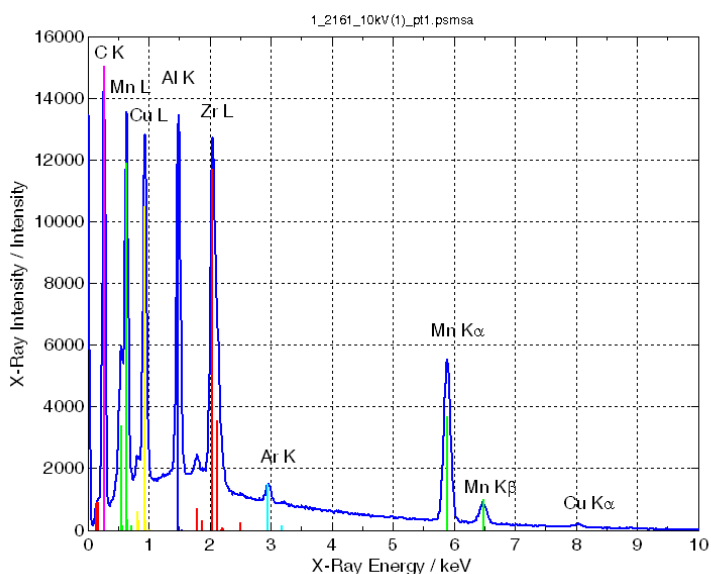

Energy dispersive X-ray spectrometers (EDS) are generally sophisticated devices with a high degree of operating reliability. Malfunctions only occur rarely, although they cannot be excluded. The causes may include poor contacts between the electronic components (particularly with older devices) or an unsealed detector window. It is therefore recommended that the EDS performance be checked on a regular basis. Such an inspection is even prescribed for a testing laboratory, accredited in compliance with DIN/EN/ISO 17075 "General requirements on the competence of testing and calibration laboratories".

The checking of the EDS performance usually consists of a recalibration of the energy scale (more precisely the channel width of the multichannel analyser) via the position of the $K\alpha$ line of Cu or Mn and the quantification of a suitable reference sample. This procedure has the following disadvantages:

- Line broadenings, which result from malfunctions of the electronics, are not considered.
- The result of the performance test depends on the choice of reference sample, whose X-ray spectrum is possibly insensitive to malfunctions.
- Detector icing is only perceptible if soft X-ray lines (below 1 keV) are also used for quantification of the reference sample.
- Quantification software updates on the part of the manufacturer may "simulate" a change in spectrometer properties.

BAM offers the EDS-TM002 test material, whose spectrum is sensitive to EDS malfunctions. All the measurements required for the performance test of an EDS on a scanning electron microscope in compliance with ISO 15632:2012 "Microbeam Analysis – Selected instrumental performance parameters for the specification and checking of energy dispersive X-ray spectrometers for use in electron probe microanalysis" can be undertaken with this single sample. It consists of a ca. 6 μm thick layer, containing the elements C, Al, Mn, Cu and Zr, on a silicon substrate.

In principle, the evaluation of the measurements is possible with the software offered by the spectrometer manufacturer. The evaluation is, however, easier and quicker to perform using the "EDX spectrometer test" software offered for the EDS-TM002. The software assumes that the detector possesses a thin-film window. It is not applicable for detectors with a beryllium window.

10 kV X-ray spectrum of the EDS-TM002 and CD with the evaluation software EDX Spectrometer Test (version 3.4, Release 28.01.2013).

Particle size distribution

CRM for particle size distribution by laser diffraction methods according to ISO 13320

BAM-D001

Description: hexagonal silicon carbide powder

Year of issue: 2012

Certified properties:

Specific particle diameter corresponding to the cumulative undersize volume distribution Q3	Equivalent spherical diameter ¹⁾ μm	Uncertainty ²⁾ μm
d_{10}	7,02	0,25
d_{50}	12,48	0,21
d_{90}	20,8	1,1

¹⁾ The certified value is the weighted mean of 13 laboratory means which participated in the interlaboratory comparison for certification according to ISO 13320:2009.

²⁾ Estimated expanded uncertainty with a coverage factor of $k=2$, corresponding to a level of confidence of about 95%, as defined in the Guide to the Expression of Uncertainty in Measurement (GUM,ISO/IEC Guide 98-3:2008).

Values for information:

Refractive index n_p ³⁾	2,645
Imaginary part k_p of particles' refractive index (absorption) ³⁾	0,1
Density ρ in g/ cm ³	3,205

³⁾ Wavelength: 633 nm

The reference materials are intended for the calibration of instruments for the determination of the molecular weight and molecular weight distribution of polymers.

Isotopic reference materials

CRMs certified for the isotopic composition of boron

Certified quantity: Isotopic composition of boron in an aqueous solution of boric acid, certified with expanded relative uncertainties of less than 0,12 %.

Application: Calibration and validation of ICP-MS procedures used for the determination of boron isotope amount ratios. Boron isotope amount ratios have to be determined within the surveillance of the primary cooling circuit in nuclear power plants equipped with a pressurized water reactor. They also have to be determined in container materials, which are doped with boron serving as a neutron shield. ERM[®]-AE124 may also be used for isotope tracer studies and as spike for isotope dilution analysis. In the latter case, however, the characterization of the boron mass fraction by reverse IDMS at the time of use might be advisable, when low measurement uncertainties (<1 % relative) are aimed at.

The materials ERM[®]-AE102a and -AE104a have been recently certified to avoid shortage of these materials.

All uncertainties indicated are expanded uncertainties $U=k\cdot u$ where $k=2$ and u is the combined standard uncertainty calculated according EURACHEM and ISO guidelines. They are given in parentheses and apply to the last one or two digits of the value.

Certified quantity: $\delta^{11}\text{B}$ relative to NIST SRM 951: $\delta^{11}\text{B}$ is a measure for the isotope variation. It is expressed as the shift of the isotopic composition relative to an internationally accepted standard given in per mill. It is calculated according to the following equation, with NIST SRM 951 (isotope reference material for boron) being used as reference: $\delta^{11}\text{B} = ((R_{\text{sample}}/R_{\text{reference}})-1)$. This certified reference material is traceable to the international δ -scale for boron with the origin being represented by NIST SRM 951.

Application: Isotope reference materials are essential to enable the determination of reliable and comparable isotope data. Besides the correction of mass fractionation or mass discrimination isotope reference materials are indispensable for validation and quality control of analytical procedures. In general δ -values of specific elements express the difference of an isotope ratio of a sample relative to an international accepted standard in per mill. Such δ -values are used in science and technology to study geochemical and environmental processes and to determine the provenance of food and the origin of forensic and archaeological artefacts.

These three boron isotope reference materials are certified for their $\delta^{11}\text{B}$ -values relative to NIST SRM 951 which is the internationally accepted origin of the δ -scale for boron. The certified $\delta^{11}\text{B}$ values cover about three-quarters of the known natural boron isotope variability. The $\delta^{11}\text{B}$ reference materials are primarily intended to be used for quality control and the validation of chemical and mass spectrometric procedures.

CRM certified for the isotopic composition of cadmium

Certified quantity: Primary isotopic reference material certified for the isotopic composition of cadmium in a dilute nitric acid solution with expanded relative uncertainties of less than 0,07 %.

Application: Calibration of any kind of mass spectrometric procedures used for the determination of cadmium isotope amount ratios. BAM-I012 represents the best measurement for cadmium isotope amount ratios as approved by IUPAC. Additionally, BAM-I012 defines the delta-scale for $\delta^{114/110}\text{Cd}$ measurements.

CRM certified for the mass fraction and the isotopic composition of palladium

Certified quantity: Spike isotopic reference material certified for the mass fraction of ^{106}Pd and the isotopic composition of palladium in 20 % hydrochloric acid with expanded relative uncertainties of 0,24 % for the mass fraction of ^{106}Pd .

Application: The spike isotopic reference material ERM[®]-AE140 is a solution of isotopically enriched Pd in 20 % hydrochloric acid and filled in flame-sealed quartz ampoules containing approximately 7 mL solution. This material is designed to serve as isotopically enriched analogue or so-called spike in Isotope Dilution Mass Spectrometry (IDMS) for the quantification of Pd.

CRM certified for the isotopic composition of lead

Certified quantity: isotopic reference material certified for the isotopic composition of lead in a dilute nitric acid solution and in bronze with expanded relative uncertainties of $\leq 0,1\%$.

Application: Calibration and validation of any kind of mass spectrometric procedures used for the determination of lead isotope amount ratios.

Isotope reference materials are essential to enable the determination of reliable and comparable isotope data. Besides the correction of mass fractionation or mass discrimination isotope reference materials are indispensable for validation and quality control of analytical procedures. ERM[®]-EB400 is the first matrix reference material certified for the Pb isotopic composition. It is best suited to calibrate and validate any Pb isotope ratio determination in metals. It helps especially for validating Pb-matrix separation procedures. Fields of application are analytical chemistry, archaeometry, geochemistry and others.

CRM certified for the isotopic composition of magnesium

Certified quantity: Primary isotopic reference materials certified for the isotopic composition of magnesium in a dilute nitric acid solution with relative expanded uncertainties of less than 0,035 %.

Application: Calibration of any kind of mass spectrometric procedures used for the determination of magnesium isotope amount ratios. ERM-AE143, ERM-AE144 and ERM-AE145 represent the best measurement for magnesium isotope amount ratios as approved by IUPAC. ERM-AE143 additionally is designed to anchor the magnesium delta-scale at $\delta^{26/24}\text{Mg} = 0$.

CRMs under development

Food

ERM[®]-BD513, ERM[®]-BD514 and ERM[®]-BD515 Cocoa, powder

Certified properties: Cd and acrylamide in cocoa

Fields of application: Method development, validation and internal laboratory quality control of analytical procedures for the quantitative determination of Cd and acrylamide in cocoa

Completion date: 2019

Zearalenone in edible oil

Certified property: Mass fraction of zearalenone

Fields of application: Method development, validation and internal laboratory quality control of analytical procedures for the quantitative determination of zearalenone in edible oils

Completion date: 2019

Isotopic reference materials

BAM-IO20 Cu solution in dilute nitric acid

Certified Properties: Cu isotopic composition

Fields of application: Method development, validation and quality control of analytical procedures for Cu isotope ratio determination

Completion date: 2019

ERM[®]-AE101a Boric acid (enriched in ¹⁰B) in water, isotopic reference material, replacement of ERM-AE101

Certified Properties: B isotopic composition

Fields of application: Calibration of boron isotope ratio measurements applied mainly by ICP-MS, method development, validation and quality control

Completion date: 2019

ERM[®]-AE125 Boric acid (enriched in ¹⁰B) in water, isotopic reference material,

Certified Properties: $\delta^{10}\text{B}$ relative to NIST SRM 951

Fields of application: Method development, validation and quality control of boron delta measurements

Completion date: 2019
